

### **Abstract**

5       Methods and systems are provided for dynamically configuring document  
solutions and for obtaining desired or required components of such document solutions  
for use with computer-generated documents. If a document is associated with a  
document solution, a request for components of the solution is sent to a manifest of  
document solutions. Identification of a user of the document is also passed to the  
10   manifest. At the manifest, identification information for the user is used to query a user  
database to determine a profile of the user such as the user's job description, location,  
security clearance, and the like. Based on the user's profile, the document solution is  
configured dynamically to include solution components most helpful to the particular  
user. A manifest collection is provided for serving as a repository of document solution  
15   location information for many different namespaces (schemas) that may be associated  
with one or more user documents.
